Cabin Management & IFE Control ALTO Articulating Plug-In Tablet Arm Holder

ALTO Aviation introduces an infinitely articulating and adjustable plug-in arm that is designed with simplicity in mind. In a strategic partnership with MyGoFlight, ALTO offers a base mount that is 100% fit compatible with an industry recognized standard base. This universal mount is designed to drop into circular Micro D-Sub or Pogo pin existing bases. The articulating arm is fully compatible with all MGF device holders allowing an array of mounting provisions for various passenger devices.

This tablet arm articulates in any direction. The arm consists of three independent joints that are adjustable and lockable from a single, centrally located control knob. The control knob allows for partial loosening and precise device positioning. You define the orientation of your tablet and simply lock into place. Once locked, it securely stays in position with no compromises. Watch your movies hands free!

Choose from an array of MGF holders to support your preferred device. Simply order your holder as needed for your device from the MyGoFlight website.

Two versions of the arm have been developed. One is a 1" version height and the other is a 6" version height. The 6" version allows the arm to be positioned over folding tables, positioned within cup holders (G200) and other obstructions in the cabin.

If you are considering adding new bases to your existing aircraft, contact ALTO to support these new installations.

ALTO continues to develop new technologies and applications associated with the arm and base. Please contact ALTO for additional product information about new offerings.

Here are some examples of the Articulating Plug-In Tablet Arm installed in a Gulfstream aircraft.
